Abstract

The aim of the study was to evaluate the antimicrobial resistance against *Salmonella* isolated from swine farms in Abia State, Nigeria. *Salmonella* isolates (n=400) were obtained from 260 faecal samples and 90 environmental samples. Of the faecal samples comprises 80 piglets, 80 growers and 80 finishers, isolates were classified into susceptible, intermediate or resistant based on NCCLS guideline. Two-third of the isolates (6.4%) were susceptible to all of the 10 antimicrobials in the antibiotic disc. No noticeable resistance was recorded for amoxicillin, ceftriaxone, cephalothin, ciprofloxacin and nalidixic acid. About 0.8% isolates were resistant to gentamycin. The frequencies of resistance were higher for tetracycline (36.49%), streptomycin (23.5%), ampicillin (9.8%) and kanamycin (14.8%). The absence of resistance to the fluoroquniolones and low resistance to amoxicillin, gentamycin are findings that would be of great importance to public and animal health. The level of common resistance observed for kanamycin, streptomycin, ampicillin and tetracycline indicates the need for a more effective use of these antimicrobials.

Keywords: *Salmonella*; resistance; multi-drug resistance; swine

Introduction

Salmonella species are the second leading cause of bacterial food borne disease worldwide. In Canada, approximately 6000 to 9000 cases of human Salmonellosis are reported annually, and for each reported illness, 13-17 cases are unreported (Thomas et al., 2006). Antimicrobial resistant *Salmonella* can cause even greater morbidity than their susceptible counterparts due to treatment failure and increased infection severity (Verma et al., 2005).

Although pork is not a major cause of Salmonellosis in America, it has been responsible for disease outbreaks of multi-resistant *Salmonella* in humans elsewhere (Molbak et al., 1999; Hedberg, 2002). Most *Salmonella* infections are acquired from contaminated food; therefore, studying antimicrobial resistance in live pigs indirectly estimates the potential for cross-contamination at slaughter and the risk to consumers from resistant organisms in pork (Van den Bogaard et al., 2000; Angulo et al., 2000).

Due to growing concern over antimicrobial resistance and its adverse effect in human and animal health, international public health has recommended antimicrobial that nations should develop surveillance programs for humans safety (World Health Organization, 1997; World Health Organization for Animal Health, 2001).

More recently, antimicrobial resistance of *Salmonella* collected from healthy swine at slaughter (Poppe et al., 2001; Sorensen et al., 2001; Larkin et al., 2004) and healthy swine at farm (Poppe et al., 2001) has been examined.

The aim of this study was to evaluate the antimicrobial resistance profiles of *Salmonella* isolated from piglets grower and finisher swines in Abia State, Nigeria.

Umudike farm (Ikwuano)	-	-	-	-	3
Total 388	69	7	42	98	172

A = Ampicillin, G = Gentamycin; K = Kanamycin; S = Streptomycin; T = Tetracycline

Table 3: Pearson correlation coefficients for resistance to various antimicrobials among *Salmonella* species isolated from pigs

Antimicrobial	Statistically significant	(P≤0.05)	Pearson's correlation coefficients
Amoxicillin (Am)	G^x (0.80)		
Kanamycin (K)	A^Y (0.15)	G (0.25)	St (0.86)
Streptomycin (S)	A (0.50)	K (0.30)	G (0.12)
Tetracycline (T)	A (0.28)	K (0.32)	K (0.20)

X = Gentamycin; Y = Ampicillin

that such type of resistance might be linked genetically with resistance to other antimicrobials.

The study suggests that there was high level correlation between occurrences of resistance to various antimicrobials as reflected in (Table 3). The result of this study shows that antimicrobial resistance and multi-drug resistance occurs in *Salmonella* isolates among piglets (growers and finisher swine).

Antimicrobials are basically used to minimize the severity of clinical cases of *Salmonella* in swine, prevent spread of infection and disease (Schwartz, 1999). The need for further study is necessary especially in the area of monitoring of antimicrobial resistance to evaluate the overall resistance trends and to detect emerging resistance phenotypes in swine.

Conclusion

Salmonella prevalence is high in swine under study. More isolates were obtained from finishers. Gentamycin recorded the least resistance to salmonella isolate.
